
CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

a. (2 pts) Convert 0100 0110 0100 1101 from base 2 to hexadecimal *464d*

b. (2 pts) Convert 110 110 100 from binary to base 8 *664*

c. (2 pts) Convert 52 from base 8 to base 2 *101 010*

d. (2 pts) Convert 7e91 from base 16 to base 2 *0111 1110 1001 0001*

e. (2 pts) Convert 011 010 from binary to base 8 *32*

f. (2 pts) Convert 1010 0010 from base 2 to base 16 *a2*

g. (2 pts) Convert 0110 1100 0110 from binary to hexadecimal *6c6*

h. (2 pts) Convert 30 from base 8 to base 2 *011 000*

i. (2 pts) Convert 1101 0010 from binary to base 10 *210*

j. (2 pts) Convert 001 101 100 from base 2 to octal *154*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double a;
    int b;
    Node c;
    char d;
    double *e;
    int *f;
    Node *g;
    char *h;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `&e` *double ***
- b. (2 pts) `g->next->next` *Node **
- c. (2 pts) `g->next` *Node **
- d. (2 pts) `c` *Node*
- e. (2 pts) `argv[1][2]` *char*
- f. (2 pts) `&c` *Node **
- g. (2 pts) `g->data` *int*
- h. (2 pts) `h` *char **
- i. (2 pts) `argv[0]` *char **
- j. (2 pts) `*f` *int*
- k. (2 pts) `argc` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt date apple lime cherry
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[1][1]`? a
- c. (2 pts) What is the value of `argv[0][1]`? /
- d. (2 pts) What is the value of `argv[2][3]`? l

End of Exam

total points=100

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).

 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

a. (2 pts) Convert 77af from hexadecimal to base 2 *0111 0111 1010 1111*

b. (2 pts) Convert 1010 1011 from base 2 to base 10 *171*

c. (2 pts) Convert 225 from base 10 to base 2 *1110 0001*

d. (2 pts) Convert 1101 1010 1101 0011 from base 2 to base 16 *dad3*

e. (2 pts) Convert 30 from octal to base 2 *011 000*

f. (2 pts) Convert 001 100 110 from base 2 to octal *146*

g. (2 pts) Convert 8f4 from base 16 to base 2 *1000 1111 0100*

h. (2 pts) Convert 62 from octal to base 2 *110 010*

i. (2 pts) Convert 011 101 000 from base 2 to octal *350*

j. (2 pts) Convert 011 000 101 from base 2 to octal *305*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    int a;
    Node b;
    double c;
    char d;
    int *e;
    Node *f;
    double *g;
    char *h;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `f->next->next` *Node **
- b. (2 pts) `f->next` *Node **
- c. (2 pts) `argc` *int*
- d. (2 pts) `*f` *Node*
- e. (2 pts) `argv[1][2]` *char*
- f. (2 pts) `a` *int*
- g. (2 pts) `&a` *int **
- h. (2 pts) `&f` *Node ***
- i. (2 pts) `f->data` *int*
- j. (2 pts) `g` *double **
- k. (2 pts) `argv[0]` *char **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```

 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 57 from octal to binary *101 111*
- b. (2 pts) Convert 101 from decimal to binary *0110 0101*
- c. (2 pts) Convert 110 011 110 from binary to base 8 *636*
- d. (2 pts) Convert 0110 0110 1011 1101 from base 2 to hexadecimal *66bd*
- e. (2 pts) Convert 010 001 101 from binary to octal *215*
- f. (2 pts) Convert 110 011 001 from binary to base 8 *631*
- g. (2 pts) Convert b2e5 from hexadecimal to binary *1011 0010 1110 0101*
- h. (2 pts) Convert 80 from decimal to base 2 *0101 0000*
- i. (2 pts) Convert 0011 1110 from binary to base 10 *62*
- j. (2 pts) Convert 111 111 100 from binary to octal *774*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    Node g;  
    double h;  
    int p;  
    char q;  
    Node *r;  
    double *s;  
    int *t;  
    char *w;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `&q` *char **
- b. (2 pts) `argv[0]` *char **
- c. (2 pts) `argc` *int*
- d. (2 pts) `&w` *char ***
- e. (2 pts) `r->next->next` *Node **
- f. (2 pts) `argv[1][2]` *char*
- g. (2 pts) `*t` *int*
- h. (2 pts) `r->next` *Node **
- i. (2 pts) `p` *int*
- j. (2 pts) `s` *double **
- k. (2 pts) `r->data` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;

 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 5 from octal to binary *101*
- b. (2 pts) Convert 1000 from binary to decimal *8*
- c. (2 pts) Convert 116 from base 10 to binary *0111 0100*
- d. (2 pts) Convert 001 000 100 from base 2 to octal *104*
- e. (2 pts) Convert 55 from octal to base 2 *101 101*
- f. (2 pts) Convert ce39 from hexadecimal to base 2 *1100 1110 0011 1001*
- g. (2 pts) Convert 001 001 from base 2 to base 8 *11*
- h. (2 pts) Convert 75 from octal to base 2 *111 101*
- i. (2 pts) Convert 0011 0000 from base 2 to decimal *48*
- j. (2 pts) Convert 2 from base 8 to base 2 *010*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    Node z;
    double a;
    int b;
    char c;
    Node *d;
    double *e;
    int *f;
    char *g;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `d->next->next` *Node **
- b. (2 pts) `argc` *int*
- c. (2 pts) `d` *Node **
- d. (2 pts) `a` *double*
- e. (2 pts) `&c` *char **
- f. (2 pts) `d->next` *Node **
- g. (2 pts) `argv[0]` *char **
- h. (2 pts) `d->data` *int*
- i. (2 pts) `*f` *int*
- j. (2 pts) `argv[1][2]` *char*
- k. (2 pts) `&f` *int ***

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt kiwi date
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[1][0]`? *k*
- c. (2 pts) What is the value of `argv[0][4]`? *n*
- d. (2 pts) What is the value of `argv[2][0]`? *d*

End of Exam

total points=100

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

a. (2 pts) Convert 89 from decimal to binary *0101 1001*

b. (2 pts) Convert 1100 0010 1100 1000 from binary to base 16 *c2c8*

c. (2 pts) Convert 011 000 101 from binary to octal *305*

d. (2 pts) Convert 101 011 100 from base 2 to base 8 *534*

e. (2 pts) Convert 100 110 100 from binary to octal *464*

f. (2 pts) Convert 104 from decimal to base 2 *0110 1000*

g. (2 pts) Convert 101 011 101 from binary to base 8 *535*

h. (2 pts) Convert 37 from base 8 to base 2 *011 111*

i. (2 pts) Convert 111 110 101 from binary to octal *765*

j. (2 pts) Convert 51 from octal to base 2 *101 001*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    int w;  
    double x;  
    Node y;  
    char z;  
    int *a;  
    double *b;  
    Node *c;  
    char *d;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `w` *int*
- b. (2 pts) `argc` *int*
- c. (2 pts) `c->next->next` *Node **
- d. (2 pts) `d` *char **
- e. (2 pts) `c->next` *Node **
- f. (2 pts) `c->data` *int*
- g. (2 pts) `&a` *int ***
- h. (2 pts) `*d` *char*
- i. (2 pts) `&y` *Node **
- j. (2 pts) `argv[1][2]` *char*
- k. (2 pts) `argv[0]` *char **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.

 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert d00c from base 16 to base 2 *1101 0000 0000 1100*

- b. (2 pts) Convert 0100 1110 0111 0111 from base 2 to base 16 *4e77*

- c. (2 pts) Convert 86c5 from hexadecimal to binary *1000 0110 1100 0101*

- d. (2 pts) Convert 150 from base 10 to base 2 *1001 0110*

- e. (2 pts) Convert d3d3 from hexadecimal to binary *1101 0011 1101 0011*

- f. (2 pts) Convert 0011 0100 0101 1100 from binary to hexadecimal *345c*

- g. (2 pts) Convert 0101 1010 1010 1000 from binary to base 16 *5aa8*

- h. (2 pts) Convert 111 from decimal to base 2 *0110 1111*

- i. (2 pts) Convert 011 001 101 from binary to base 8 *315*

- j. (2 pts) Convert 33 from base 8 to base 2 *011 011*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    double r;  
    Node s;  
    int t;  
    char w;  
    double *x;  
    Node *y;  
    int *z;  
    char *a;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argv[1][2]` *char*
- b. (2 pts) `y` *Node **
- c. (2 pts) `y->next` *Node **
- d. (2 pts) `y->next->next` *Node **
- e. (2 pts) `argv[0]` *char **
- f. (2 pts) `&x` *double ***
- g. (2 pts) `*x` *double*
- h. (2 pts) `&r` *double **
- i. (2 pts) `y->data` *int*
- j. (2 pts) `argc` *int*
- k. (2 pts) `w` *char*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt fig lime
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[2][0]`? *l*
- c. (2 pts) What is the value of `argv[1][0]`? *f*
- d. (2 pts) What is the value of `argv[0][5]`? *I*

total points=100

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

a. (2 pts) Convert 2868 from base 16 to base 2 *0010 1000 0110 1000*

b. (2 pts) Convert 241 from base 10 to binary *1111 0001*

c. (2 pts) Convert 44 from decimal to base 2 *0010 1100*

d. (2 pts) Convert 24 from octal to base 2 *010 100*

e. (2 pts) Convert 21 from base 8 to base 2 *010 001*

f. (2 pts) Convert 001 101 011 from binary to octal *153*

g. (2 pts) Convert 1010 1100 from base 2 to decimal *172*

h. (2 pts) Convert 5 from octal to base 2 *101*

i. (2 pts) Convert 010 110 010 from base 2 to base 8 *262*

j. (2 pts) Convert 0111 1001 1011 1000 from binary to hexadecimal *79b8*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    double d;  
    Node e;  
    int f;  
    char g;  
    double *h;  
    Node *p;  
    int *q;  
    char *r;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `p->next` *Node **
- b. (2 pts) `*r` *char*
- c. (2 pts) `&r` *char ***
- d. (2 pts) `argv[0]` *char **
- e. (2 pts) `f` *int*
- f. (2 pts) `&d` *double **
- g. (2 pts) `p->next->next` *Node **
- h. (2 pts) `r` *char **
- i. (2 pts) `argv[1][2]` *char*
- j. (2 pts) `p->data` *int*
- k. (2 pts) `argc` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt banana lime
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[1][2]`? *n*
- c. (2 pts) What is the value of `argv[2][0]`? *l*
- d. (2 pts) What is the value of `argv[0][6]`? *t*

End of Exam

total points=100

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

-

1. Please perform the following number conversions.

a. (2 pts) Convert 1001 1110 1010 1010 from binary to hexadecimal *9eaa*

b. (2 pts) Convert 0111 1100 1111 0001 from base 2 to hexadecimal *7cf1*

c. (2 pts) Convert 010 100 000 from binary to octal *240*

d. (2 pts) Convert 0011 1010 from base 2 to decimal *58*

e. (2 pts) Convert 125 from base 10 to binary *0111 1101*

f. (2 pts) Convert 1 from base 10 to binary *0001*

g. (2 pts) Convert 010 110 000 from base 2 to base 8 *260*

h. (2 pts) Convert 6 from base 10 to base 2 *0110*

i. (2 pts) Convert 1100 0100 from base 2 to base 10 *196*

j. (2 pts) Convert 20 from base 8 to base 2 *010 000*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    int r;
    Node s;
    double t;
    char w;
    int *x;
    Node *y;
    double *z;
    char *a;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `&s` *Node **
- b. (2 pts) `*x` *int*
- c. (2 pts) `&z` *double ***
- d. (2 pts) `y->data` *int*
- e. (2 pts) `argv[1][2]` *char*
- f. (2 pts) `argc` *int*
- g. (2 pts) `argv[0]` *char **
- h. (2 pts) `t` *double*
- i. (2 pts) `y` *Node **
- j. (2 pts) `y->next` *Node **
- k. (2 pts) `y->next->next` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```

```

- a. (2 pts) What is the value of `argc` in this case? *4*
- b. (2 pts) What is the value of `argv[2][5]`? *y*
- c. (2 pts) What is the value of `argv[0][3]`? *u*
- d. (2 pts) What is the value of `argv[1][0]`? *a*

End of Exam

total points=100

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 1110 0011 from base 2 to base 10 *227*
- b. (2 pts) Convert 0011 0111 from base 2 to base 10 *55*
- c. (2 pts) Convert 0011 1110 0100 0110 from base 2 to hexadecimal *3e46*
- d. (2 pts) Convert 61 from octal to binary *110 001*
- e. (2 pts) Convert 0110 0001 0000 0000 from base 2 to base 16 *6100*
- f. (2 pts) Convert 1001 1011 from base 2 to decimal *155*
- g. (2 pts) Convert 100 from binary to octal *4*
- h. (2 pts) Convert 142 from base 10 to base 2 *1000 1110*
- i. (2 pts) Convert 100 011 110 from binary to octal *436*
- j. (2 pts) Convert 1101 1101 1100 1110 from binary to base 16 *ddce*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double h;
    Node p;
    int q;
    char r;
    double *s;
    Node *t;
    int *w;
    char *x;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argv[0]` *char **
- b. (2 pts) `*w` *int*
- c. (2 pts) `argv[1][2]` *char*
- d. (2 pts) `s` *double **
- e. (2 pts) `t->data` *int*
- f. (2 pts) `t->next->next` *Node **
- g. (2 pts) `&t` *Node ***
- h. (2 pts) `argc` *int*
- i. (2 pts) `t->next` *Node **
- j. (2 pts) `h` *double*
- k. (2 pts) `&h` *double **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {  
    assert(list!=NULL); // if list is NULL, we can do nothing.  
  
    Node *p;  
  
    p = new Node;  
  
    p->data = value;  
  
    p->next = NULL;  
  
    if (list->head == NULL) {  
        list->head = new Node;  
        list->head = p;  
    } else {  
        list->tail->next = p;  
        list -> tail = p;  
    }  
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt grape mango
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[2][3]`? g
- c. (2 pts) What is the value of `argv[1][0]`? g
- d. (2 pts) What is the value of `argv[0][1]`? /

End of Exam

total points=100

CS16—Final Exam

 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

a. (2 pts) Convert e4db from hexadecimal to binary *1110 0100 1101 1011*

b. (2 pts) Convert 4ef6 from hexadecimal to base 2 *0100 1110 1111 0110*

c. (2 pts) Convert 0001 0101 from binary to base 10 *21*

d. (2 pts) Convert 100 100 000 from base 2 to octal *440*

e. (2 pts) Convert 0100 1011 0101 1001 from binary to base 16 *4b59*

f. (2 pts) Convert 76 from octal to base 2 *111 110*

g. (2 pts) Convert 1011 1111 from base 2 to base 10 *191*

h. (2 pts) Convert 198 from base 10 to binary *1100 0110*

i. (2 pts) Convert 8 from base 10 to binary *1000*

j. (2 pts) Convert 2 from base 8 to binary *010*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    int r;  
    double s;  
    Node t;  
    char w;  
    int *x;  
    double *y;  
    Node *z;  
    char *a;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `s` *double*
- b. (2 pts) `z->next` *Node **
- c. (2 pts) `y` *double **
- d. (2 pts) `argv[1][2]` *char*
- e. (2 pts) `argv[0]` *char **
- f. (2 pts) `argc` *int*
- g. (2 pts) `z->next->next` *Node **
- h. (2 pts) `z->data` *int*
- i. (2 pts) `&x` *int ***
- j. (2 pts) `*a` *char*
- k. (2 pts) `&w` *char **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt banana date kiwi mango
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[0][2]`? *r*
- c. (2 pts) What is the value of `argv[1][1]`? *a*
- d. (2 pts) What is the value of `argv[2][2]`? *t*

1. Please perform the following number conversions.

a. (2 pts) Convert 22 from base 10 to base 2 *0001 0110*

b. (2 pts) Convert 32 from decimal to binary *0010 0000*

c. (2 pts) Convert 0100 1011 1101 1011 from binary to base 16 *4bdb*

d. (2 pts) Convert 1110 1100 from base 2 to decimal *236*

e. (2 pts) Convert 50 from octal to base 2 *101 000*

f. (2 pts) Convert 45 from base 10 to binary *0010 1101*

g. (2 pts) Convert 1100 0010 from binary to decimal *194*

h. (2 pts) Convert 47 from decimal to binary *0010 1111*

i. (2 pts) Convert 170 from base 10 to base 2 *1010 1010*

j. (2 pts) Convert 001 101 000 from base 2 to octal *150*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double s;
    int t;
    Node w;
    char x;
    double *y;
    int *z;
    Node *a;
    char *b;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `&w` *Node **
- b. (2 pts) `argc` *int*
- c. (2 pts) `argv[0]` *char **
- d. (2 pts) `a->data` *int*
- e. (2 pts) `a->next->next` *Node **
- f. (2 pts) `&a` *Node ***
- g. (2 pts) `w` *Node*
- h. (2 pts) `a->next` *Node **
- i. (2 pts) `argv[1][2]` *char*
- j. (2 pts) `y` *double **
- k. (2 pts) `*b` *char*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt guava grape fig kiwi
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[0][2]`? *r*
- c. (2 pts) What is the value of `argv[2][4]`? *e*
- d. (2 pts) What is the value of `argv[1][3]`? *v*

End of Exam

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 0101 1011 0001 1101 from base 2 to hexadecimal *5b1d*
- b. (2 pts) Convert 66 from base 8 to base 2 *110 110*
- c. (2 pts) Convert 0011 1001 1011 1100 from base 2 to base 16 *39bc*
- d. (2 pts) Convert 120 from base 10 to binary *0111 1000*
- e. (2 pts) Convert 1000 0100 from binary to base 10 *132*
- f. (2 pts) Convert 1100 0111 from base 2 to decimal *199*
- g. (2 pts) Convert 0110 1100 from base 2 to decimal *108*
- h. (2 pts) Convert b723 from base 16 to binary *1011 0111 0010 0011*
- i. (2 pts) Convert 748e from hexadecimal to binary *0111 0100 1000 1110*
- j. (2 pts) Convert 110 100 000 from base 2 to octal *640*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    Node a;
    int b;
    double c;
    char d;
    Node *e;
    int *f;
    double *g;
    char *h;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `e->next->next` *Node **
- b. (2 pts) `h` *char **
- c. (2 pts) `a` *Node*
- d. (2 pts) `e->next` *Node **
- e. (2 pts) `argc` *int*
- f. (2 pts) `*e` *Node*
- g. (2 pts) `&b` *int **
- h. (2 pts) `e->data` *int*
- i. (2 pts) `argv[0]` *char **
- j. (2 pts) `&e` *Node ***
- k. (2 pts) `argv[1][2]` *char*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time

struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt grape fig lime guava
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[0][1]`? /
- c. (2 pts) What is the value of `argv[2][1]`? i
- d. (2 pts) What is the value of `argv[1][1]`? r

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 12 from octal to base 2 *001 010*
- b. (2 pts) Convert 91e from hexadecimal to binary *1001 0001 1110*
- c. (2 pts) Convert 0011 from base 2 to base 10 *3*
- d. (2 pts) Convert 0001 1100 from base 2 to base 10 *28*
- e. (2 pts) Convert 001 011 101 from binary to base 8 *135*
- f. (2 pts) Convert 1001 0101 0011 1101 from binary to hexadecimal *953d*
- g. (2 pts) Convert 0110 1001 from binary to base 10 *105*
- h. (2 pts) Convert 4e34 from hexadecimal to binary *0100 1110 0011 0100*
- i. (2 pts) Convert 1101 0010 from binary to base 10 *210*
- j. (2 pts) Convert 50 from base 8 to base 2 *101 000*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    int h;
    double p;
    Node q;
    char r;
    int *s;
    double *t;
    Node *w;
    char *x;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `w->data` *int*
- b. (2 pts) `&w` *Node ***
- c. (2 pts) `argv[1][2]` *char*
- d. (2 pts) `argv[0]` *char **
- e. (2 pts) `w->next` *Node **
- f. (2 pts) `r` *char*
- g. (2 pts) `*t` *double*
- h. (2 pts) `s` *int **
- i. (2 pts) `&q` *Node **
- j. (2 pts) `w->next->next` *Node **
- k. (2 pts) `argc` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt fig guava date grape
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[2][1]`? u
- c. (2 pts) What is the value of `argv[0][3]`? u
- d. (2 pts) What is the value of `argv[1][2]`? g

- j. (2 pts) Convert 0100 1011 0110 1000 from binary to hexadecimal *4b68*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    Node x;  
    double y;  
    int z;  
    char a;  
    Node *b;  
    double *c;  
    int *d;  
    char *e;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `&e` *char ***
- b. (2 pts) `&y` *double **
- c. (2 pts) `argv[0]` *char **
- d. (2 pts) `y` *double*
- e. (2 pts) `b->data` *int*
- f. (2 pts) `argv[1][2]` *char*
- g. (2 pts) `b->next` *Node **
- h. (2 pts) `b->next->next` *Node **
- i. (2 pts) `*d` *int*
- j. (2 pts) `c` *double **
- k. (2 pts) `argc` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt grape apple
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[1][3]`? p
- c. (2 pts) What is the value of `argv[0][0]`? .
- d. (2 pts) What is the value of `argv[2][3]`? l

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 2 from base 8 to binary *010*
- b. (2 pts) Convert 001 000 000 from base 2 to octal *100*
- c. (2 pts) Convert 1000 0100 1000 0000 from base 2 to base 16 *8480*
- d. (2 pts) Convert ef97 from hexadecimal to base 2 *1110 1111 1001 0111*
- e. (2 pts) Convert 0110 0101 from binary to decimal *101*
- f. (2 pts) Convert 110 010 100 from base 2 to octal *624*
- g. (2 pts) Convert 1111 0111 1111 from binary to base 16 *f7f*
- h. (2 pts) Convert 4 from decimal to binary *0100*
- i. (2 pts) Convert 0101 1001 from base 2 to base 10 *89*
- j. (2 pts) Convert 1110 0111 0101 0011 from base 2 to hexadecimal *e753*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    double d;  
    Node e;  
    int f;  
    char g;  
    double *h;  
    Node *p;  
    int *q;  
    char *r;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `p->next->next` *Node **
- b. (2 pts) `*r` *char*
- c. (2 pts) `&d` *double **
- d. (2 pts) `argc` *int*
- e. (2 pts) `argv[0]` *char **
- f. (2 pts) `g` *char*
- g. (2 pts) `argv[1][2]` *char*
- h. (2 pts) `h` *double **
- i. (2 pts) `p->data` *int*
- j. (2 pts) `&q` *int ***
- k. (2 pts) `p->next` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt date apple
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[0][6]`? *t*
- c. (2 pts) What is the value of `argv[1][0]`? *d*
- d. (2 pts) What is the value of `argv[2][2]`? *p*

End of Exam

- j. (2 pts) Convert 1010 1111 0111 1110 from base 2 to hexadecimal *af7e*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    int a;  
    Node b;  
    double c;  
    char d;  
    int *e;  
    Node *f;  
    double *g;  
    char *h;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `*e` *int*
- b. (2 pts) `&c` *double **
- c. (2 pts) `f->next` *Node **
- d. (2 pts) `argv[1][2]` *char*
- e. (2 pts) `&f` *Node ***
- f. (2 pts) `argc` *int*
- g. (2 pts) `f->next->next` *Node **
- h. (2 pts) `c` *double*
- i. (2 pts) `argv[0]` *char **
- j. (2 pts) `f->data` *int*
- k. (2 pts) `g` *double **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

int main(int argc, char *argv[]) {  
    int r;  
    double s;  
    Node t;  
    char w;  
    int *x;  
    double *y;  
    Node *z;  
    char *a;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `*x` *int*
- b. (2 pts) `z->data` *int*
- c. (2 pts) `t` *Node*
- d. (2 pts) `y` *double **
- e. (2 pts) `argc` *int*
- f. (2 pts) `&t` *Node **
- g. (2 pts) `&x` *int ***
- h. (2 pts) `z->next` *Node **
- i. (2 pts) `z->next->next` *Node **
- j. (2 pts) `argv[0]` *char **
- k. (2 pts) `argv[1][2]` *char*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt mango lime fig banana
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[0][6]`? *t*
- c. (2 pts) What is the value of `argv[1][2]`? *n*
- d. (2 pts) What is the value of `argv[2][1]`? *i*

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 31 from decimal to base 2 *0001 1111*
- b. (2 pts) Convert 8df from base 16 to binary *1000 1101 1111*
- c. (2 pts) Convert 0011 1100 from binary to decimal *60*
- d. (2 pts) Convert 111 110 from binary to octal *76*
- e. (2 pts) Convert 242 from decimal to binary *1111 0010*
- f. (2 pts) Convert 31bb from base 16 to binary *0011 0001 1011 1011*
- g. (2 pts) Convert 1011 0111 from binary to decimal *183*
- h. (2 pts) Convert 22c8 from hexadecimal to base 2 *0010 0010 1100 1000*
- i. (2 pts) Convert 100 000 011 from base 2 to base 8 *403*
- j. (2 pts) Convert 56fc from base 16 to base 2 *0101 0110 1111 1100*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    int h;  
    double p;  
    Node q;  
    char r;  
    int *s;  
    double *t;  
    Node *w;  
    char *x;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `h` *int*
- b. (2 pts) `argv[0]` *char **
- c. (2 pts) `argv[1][2]` *char*
- d. (2 pts) `s` *int **
- e. (2 pts) `&p` *double **
- f. (2 pts) `&w` *Node ***
- g. (2 pts) `w->data` *int*
- h. (2 pts) `*t` *double*
- i. (2 pts) `w->next` *Node **
- j. (2 pts) `argc` *int*
- k. (2 pts) `w->next->next` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time

- h. (2 pts) `argv[0]` *char **
- i. (2 pts) `h` *char **
- j. (2 pts) `&d` *char **
- k. (2 pts) `b` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;

- j. (2 pts) Convert 1f28 from hexadecimal to binary *0001 1111 0010 1000*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double x;
    Node y;
    int z;
    char a;
    double *b;
    Node *c;
    int *d;
    char *e;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `c->next` *Node **
- b. (2 pts) `argv[1][2]` *char*
- c. (2 pts) `&z` *int **
- d. (2 pts) `argc` *int*
- e. (2 pts) `c->data` *int*
- f. (2 pts) `d` *int **
- g. (2 pts) `argv[0]` *char **
- h. (2 pts) `c->next->next` *Node **
- i. (2 pts) `x` *double*
- j. (2 pts) `*d` *int*
- k. (2 pts) `&d` *int ***

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt date mango
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[1][2]`? *t*
- c. (2 pts) What is the value of `argv[2][4]`? *o*
- d. (2 pts) What is the value of `argv[0][4]`? *n*

End of Exam

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 1000 1001 1101 1010 from binary to base 16 *89da*
- b. (2 pts) Convert 124 from decimal to binary *0111 1100*
- c. (2 pts) Convert 110 000 011 from base 2 to base 8 *603*
- d. (2 pts) Convert 010 000 000 from base 2 to octal *200*
- e. (2 pts) Convert 1 from base 8 to binary *001*
- f. (2 pts) Convert 0011 1010 from binary to base 10 *58*
- g. (2 pts) Convert f327 from hexadecimal to base 2 *1111 0011 0010 0111*
- h. (2 pts) Convert 175 from decimal to binary *1010 1111*
- i. (2 pts) Convert 10 from base 8 to binary *001 000*
- j. (2 pts) Convert 52 from base 8 to binary *101 010*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    Node r;  
    double s;  
    int t;  
    char w;  
    Node *x;  
    double *y;  
    int *z;  
    char *a;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `x->next->next` *Node **
- b. (2 pts) `argv[1][2]` *char*
- c. (2 pts) `*y` *double*
- d. (2 pts) `argc` *int*
- e. (2 pts) `&t` *int **
- f. (2 pts) `&z` *int ***
- g. (2 pts) `x->data` *int*
- h. (2 pts) `argv[0]` *char **
- i. (2 pts) `y` *double **
- j. (2 pts) `r` *Node*
- k. (2 pts) `x->next` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;

- i. (2 pts) Convert 43 from octal to binary *100 011*
- j. (2 pts) Convert 0111 0000 from base 2 to base 10 *112*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double z;
    int a;
    Node b;
    char c;
    double *d;
    int *e;
    Node *f;
    char *g;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argv[0]` *char **
- b. (2 pts) `c` *char*
- c. (2 pts) `&f` *Node ***
- d. (2 pts) `argv[1][2]` *char*
- e. (2 pts) `f->data` *int*
- f. (2 pts) `&z` *double **
- g. (2 pts) `f->next->next` *Node **
- h. (2 pts) `argc` *int*
- i. (2 pts) `*f` *Node*
- j. (2 pts) `f->next` *Node **
- k. (2 pts) `d` *double **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt cherry mango kiwi date
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[2][4]`? o
- c. (2 pts) What is the value of `argv[0][3]`? u
- d. (2 pts) What is the value of `argv[1][0]`? c

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 68 from decimal to base 2 *0100 0100*
- b. (2 pts) Convert 60 from octal to base 2 *110 000*
- c. (2 pts) Convert 211 from decimal to binary *1101 0011*
- d. (2 pts) Convert 180 from base 10 to binary *1011 0100*
- e. (2 pts) Convert 22e4 from base 16 to base 2 *0010 0010 1110 0100*
- f. (2 pts) Convert 161 from decimal to binary *1010 0001*
- g. (2 pts) Convert 4936 from base 16 to base 2 *0100 1001 0011 0110*
- h. (2 pts) Convert 40 from base 10 to binary *0010 1000*
- i. (2 pts) Convert 0101 1000 1110 0011 from base 2 to base 16 *58e3*
- j. (2 pts) Convert 3 from octal to base 2 *011*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    int w;
    Node x;
    double y;
    char z;
    int *a;
    Node *b;
    double *c;
    char *d;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argv[1][2]` *char*
- b. (2 pts) `y` *double*
- c. (2 pts) `b->next->next` *Node **
- d. (2 pts) `&a` *int ***
- e. (2 pts) `argv[0]` *char **
- f. (2 pts) `b->data` *int*
- g. (2 pts) `argc` *int*
- h. (2 pts) `d` *char **
- i. (2 pts) `&z` *char **
- j. (2 pts) `b->next` *Node **
- k. (2 pts) `*a` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {  
  
    assert(list!=NULL); // if list is NULL, we can do nothing.  
  
    Node *p;  
  
    p = new Node;  
  
    p->data = value;  
  
    p->next = NULL;  
  
    if (list->head == NULL) {  
        list->head = new Node;  
        list->head = p;  
    } else {  
        list->tail->next = p;  
        list -> tail = p;  
    }  
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt apple cherry lime
```

- a. (2 pts) What is the value of `argc` in this case? 4
- b. (2 pts) What is the value of `argv[2][2]`? e
- c. (2 pts) What is the value of `argv[1][2]`? p
- d. (2 pts) What is the value of `argv[0][2]`? r

End of Exam

- g. (2 pts) Convert 4708 from hexadecimal to binary *0100 0111 0000 1000*
- h. (2 pts) Convert 1011 1111 from binary to decimal *191*
- i. (2 pts) Convert 1011 0111 0010 1000 from base 2 to hexadecimal *b728*
- j. (2 pts) Convert 1101 1111 1101 1101 from binary to hexadecimal *dfdd*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    double t;  
    int w;  
    Node x;  
    char y;  
    double *z;  
    int *a;  
    Node *b;  
    char *c;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `b->data` *int*
- b. (2 pts) `b->next->next` *Node **
- c. (2 pts) `&t` *double **
- d. (2 pts) `*z` *double*
- e. (2 pts) `argc` *int*
- f. (2 pts) `argv[0]` *char **
- g. (2 pts) `w` *int*
- h. (2 pts) `b->next` *Node **
- i. (2 pts) `argv[1][2]` *char*
- j. (2 pts) `c` *char **
- k. (2 pts) `&b` *Node ***

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt mango lemon date fig
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[1][3]`? g
- c. (2 pts) What is the value of `argv[2][0]`? l
- d. (2 pts) What is the value of `argv[0][6]`? t

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 26 from base 8 to binary *010 110*
- b. (2 pts) Convert 101 010 101 from base 2 to base 8 *525*
- c. (2 pts) Convert 8b4f from base 16 to base 2 *1000 1011 0100 1111*
- d. (2 pts) Convert 71 from octal to base 2 *111 001*
- e. (2 pts) Convert 101 100 000 from base 2 to octal *540*
- f. (2 pts) Convert 1000 1000 0101 from binary to hexadecimal *885*
- g. (2 pts) Convert 111 100 001 from base 2 to octal *741*
- h. (2 pts) Convert 70 from base 10 to binary *0100 0110*
- i. (2 pts) Convert 40 from octal to base 2 *100 000*
- j. (2 pts) Convert 0111 1011 1100 1000 from base 2 to hexadecimal *7bc8*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    Node q;
    int r;
    double s;
    char t;
    Node *w;
    int *x;
    double *y;
    char *z;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argc` *int*
- b. (2 pts) `&x` *int ***
- c. (2 pts) `w->data` *int*
- d. (2 pts) `w->next` *Node **
- e. (2 pts) `t` *char*
- f. (2 pts) `y` *double **
- g. (2 pts) `argv[1][2]` *char*
- h. (2 pts) `*x` *int*
- i. (2 pts) `w->next->next` *Node **
- j. (2 pts) `&q` *Node **
- k. (2 pts) `argv[0]` *char **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```

- j. (2 pts) Convert 875c from base 16 to base 2 *1000 0111 0101 1100*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    double c;  
    Node d;  
    int e;  
    char f;  
    double *g;  
    Node *h;  
    int *p;  
    char *q;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argv[1][2]` *char*
- b. (2 pts) `&f` *char **
- c. (2 pts) `h->next->next` *Node **
- d. (2 pts) `argc` *int*
- e. (2 pts) `h->next` *Node **
- f. (2 pts) `*h` *Node*
- g. (2 pts) `h->data` *int*
- h. (2 pts) `&q` *char ***
- i. (2 pts) `h` *Node **
- j. (2 pts) `argv[0]` *char **
- k. (2 pts) `e` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt kiwi grape
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[0][4]`? *n*
- c. (2 pts) What is the value of `argv[1][0]`? *k*
- d. (2 pts) What is the value of `argv[2][4]`? *e*

- j. (2 pts) Convert 2346 from base 16 to base 2 *0010 0011 0100 0110*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double z;
    int a;
    Node b;
    char c;
    double *d;
    int *e;
    Node *f;
    char *g;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argv[0]` *char **
- b. (2 pts) `argv[1][2]` *char*
- c. (2 pts) `&f` *Node ***
- d. (2 pts) `d` *double **
- e. (2 pts) `f->next->next` *Node **
- f. (2 pts) `argc` *int*
- g. (2 pts) `&b` *Node **
- h. (2 pts) `a` *int*
- i. (2 pts) `f->data` *int*
- j. (2 pts) `f->next` *Node **
- k. (2 pts) `*f` *Node*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt mango lemon cherry fig
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[1][0]`? *m*
- c. (2 pts) What is the value of `argv[0][0]`? .
- d. (2 pts) What is the value of `argv[2][2]`? *m*

End of Exam

total points=100

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 0010 0111 from binary to base 10 39
- b. (2 pts) Convert 1101 1001 from base 2 to decimal 217
- c. (2 pts) Convert 010 101 001 from base 2 to octal 251
- d. (2 pts) Convert 1000 0111 1100 0010 from binary to hexadecimal 87c2
- e. (2 pts) Convert 26 from base 8 to binary 010 110
- f. (2 pts) Convert 214 from base 10 to base 2 1101 0110
- g. (2 pts) Convert 111 011 101 from binary to base 8 735
- h. (2 pts) Convert 1101 1110 from binary to decimal 222
- i. (2 pts) Convert 1101 1111 1000 0101 from base 2 to hexadecimal df85
- j. (2 pts) Convert 0100 1111 1000 0111 from base 2 to base 16 4f87

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    int a;
    double b;
    Node c;
    char d;
    int *e;
    double *f;
    Node *g;
    char *h;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `g->data` *int*
- b. (2 pts) `argv[1][2]` *char*
- c. (2 pts) `argv[0]` *char **
- d. (2 pts) `*g` *Node*
- e. (2 pts) `h` *char **
- f. (2 pts) `g->next` *Node **
- g. (2 pts) `c` *Node*
- h. (2 pts) `&b` *double **
- i. (2 pts) `&h` *char ***
- j. (2 pts) `g->next->next` *Node **
- k. (2 pts) `argc` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt kiwi cherry lemon banana
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[0][2]`? *r*
- c. (2 pts) What is the value of `argv[2][3]`? *r*
- d. (2 pts) What is the value of `argv[1][1]`? *i*

- i. (2 pts) Convert 47 from base 8 to binary *100 111*
- j. (2 pts) Convert 247 from decimal to binary *1111 0111*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    int z;  
    double a;  
    Node b;  
    char c;  
    int *d;  
    double *e;  
    Node *f;  
    char *g;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argc` *int*
- b. (2 pts) `&d` *int ***
- c. (2 pts) `c` *char*
- d. (2 pts) `f->next` *Node **
- e. (2 pts) `&z` *int **
- f. (2 pts) `f->data` *int*
- g. (2 pts) `argv[1][2]` *char*
- h. (2 pts) `argv[0]` *char **
- i. (2 pts) `f->next->next` *Node **
- j. (2 pts) `d` *int **
- k. (2 pts) `*g` *char*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt fig guava apple date
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[0][2]`? *r*
- c. (2 pts) What is the value of `argv[1][1]`? *i*
- d. (2 pts) What is the value of `argv[2][2]`? *a*

End of Exam

total points=100

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 010 010 from binary to octal *22*
- b. (2 pts) Convert f085 from hexadecimal to binary *1111 0000 1000 0101*
- c. (2 pts) Convert 65 from base 8 to base 2 *110 101*
- d. (2 pts) Convert 010 110 110 from base 2 to octal *266*
- e. (2 pts) Convert 44 from base 8 to binary *100 100*
- f. (2 pts) Convert 1011 0010 0110 from binary to hexadecimal *b26*
- g. (2 pts) Convert 945f from base 16 to base 2 *1001 0100 0101 1111*
- h. (2 pts) Convert 1001 0011 from base 2 to base 10 *147*
- i. (2 pts) Convert 6627 from hexadecimal to base 2 *0110 0110 0010 0111*
- j. (2 pts) Convert 146 from decimal to binary *1001 0010*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    int t;
    double w;
    Node x;
    char y;
    int *z;
    double *a;
    Node *b;
    char *c;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `b->next->next` *Node **
- b. (2 pts) `*z` *int*
- c. (2 pts) `argc` *int*
- d. (2 pts) `b->next` *Node **
- e. (2 pts) `x` *Node*
- f. (2 pts) `argv[0]` *char **
- g. (2 pts) `c` *char **
- h. (2 pts) `&y` *char **
- i. (2 pts) `b->data` *int*
- j. (2 pts) `&b` *Node ***
- k. (2 pts) `argv[1][2]` *char*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt banana grape mango fig
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[1][1]`? *a*
- c. (2 pts) What is the value of `argv[0][5]`? *I*
- d. (2 pts) What is the value of `argv[2][0]`? *g*

End of Exam

-

1. Please perform the following number conversions.

- a. (2 pts) Convert 0011 1011 from binary to base 10 *59*
- b. (2 pts) Convert 1101 1001 1110 0110 from base 2 to hexadecimal *d9e6*
- c. (2 pts) Convert 70 from octal to base 2 *111 000*
- d. (2 pts) Convert 81a2 from hexadecimal to base 2 *1000 0001 1010 0010*
- e. (2 pts) Convert 110 100 010 from base 2 to octal *642*
- f. (2 pts) Convert 1001 1101 0010 0000 from base 2 to hexadecimal *9d20*
- g. (2 pts) Convert 541d from base 16 to base 2 *0101 0100 0001 1101*
- h. (2 pts) Convert 15 from base 8 to base 2 *001 101*
- i. (2 pts) Convert 100 000 011 from binary to base 8 *403*
- j. (2 pts) Convert 1110 1001 0110 0010 from base 2 to hexadecimal *e962*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    Node a;  
    double b;  
    int c;  
    char d;  
    Node *e;  
    double *f;  
    int *g;  
    char *h;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argv[1][2]` *char*
- b. (2 pts) `d` *char*
- c. (2 pts) `&a` *Node **
- d. (2 pts) `&h` *char ***
- e. (2 pts) `e->next` *Node **
- f. (2 pts) `argv[0]` *char **
- g. (2 pts) `argc` *int*
- h. (2 pts) `e->next->next` *Node **
- i. (2 pts) `h` *char **
- j. (2 pts) `*f` *double*
- k. (2 pts) `e->data` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt lemon grape
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[0][3]`? *u*
- c. (2 pts) What is the value of `argv[1][1]`? *e*
- d. (2 pts) What is the value of `argv[2][0]`? *g*

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 80c5 from base 16 to base 2 *1000 0000 1100 0101*
- b. (2 pts) Convert 1001 0100 from binary to decimal *148*
- c. (2 pts) Convert d189 from base 16 to binary *1101 0001 1000 1001*
- d. (2 pts) Convert d8c from hexadecimal to binary *1101 1000 1100*
- e. (2 pts) Convert 180 from base 10 to binary *1011 0100*
- f. (2 pts) Convert 0011 0110 1111 1101 from binary to hexadecimal *36fd*
- g. (2 pts) Convert fe0e from hexadecimal to base 2 *1111 1110 0000 1110*
- h. (2 pts) Convert 188 from decimal to base 2 *1011 1100*
- i. (2 pts) Convert 0100 1011 from base 2 to decimal *75*
- j. (2 pts) Convert 854c from hexadecimal to base 2 *1000 0101 0100 1100*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double x;
    int y;
    Node z;
    char a;
    double *b;
    int *c;
    Node *d;
    char *e;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argv[1][2]` *char*
- b. (2 pts) `argv[0]` *char **
- c. (2 pts) `d->next` *Node **
- d. (2 pts) `&d` *Node ***
- e. (2 pts) `*e` *char*
- f. (2 pts) `d->data` *int*
- g. (2 pts) `z` *Node*
- h. (2 pts) `d->next->next` *Node **
- i. (2 pts) `&a` *char **
- j. (2 pts) `argc` *int*
- k. (2 pts) `d` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11

- h. (2 pts) `s->data` *int*
- i. (2 pts) `*t` *double*
- j. (2 pts) `&w` *char ***
- k. (2 pts) `s` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;

- i. (2 pts) Convert 55 from octal to binary *101 101*
- j. (2 pts) Convert 0100 1101 0111 1000 from base 2 to hexadecimal *4d78*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    Node d;  
    double e;  
    int f;  
    char g;  
    Node *h;  
    double *p;  
    int *q;  
    char *r;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argc` *int*
- b. (2 pts) `e` *double*
- c. (2 pts) `h->next->next` *Node **
- d. (2 pts) `&e` *double **
- e. (2 pts) `h` *Node **
- f. (2 pts) `h->data` *int*
- g. (2 pts) `h->next` *Node **
- h. (2 pts) `argv[1][2]` *char*
- i. (2 pts) `&p` *double ***
- j. (2 pts) `*h` *Node*
- k. (2 pts) `argv[0]` *char **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt banana kiwi
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[2][3]`? *i*
- c. (2 pts) What is the value of `argv[1][3]`? *a*
- d. (2 pts) What is the value of `argv[0][5]`? *I*

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 23 from octal to binary *010 011*
- b. (2 pts) Convert 1100 0010 from base 2 to base 10 *194*
- c. (2 pts) Convert 100 110 110 from base 2 to octal *466*
- d. (2 pts) Convert 101 100 010 from binary to octal *542*
- e. (2 pts) Convert 5ea7 from base 16 to binary *0101 1110 1010 0111*
- f. (2 pts) Convert 0100 from base 2 to decimal *4*
- g. (2 pts) Convert 1111 1011 1110 0000 from binary to hexadecimal *fb e0*
- h. (2 pts) Convert 0101 0011 from base 2 to decimal *83*
- i. (2 pts) Convert 52 from octal to base 2 *101 010*
- j. (2 pts) Convert 590c from hexadecimal to base 2 *0101 1001 0000 1100*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    Node w;
    double x;
    int y;
    char z;
    Node *a;
    double *b;
    int *c;
    char *d;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argc` *int*
- b. (2 pts) `a->data` *int*
- c. (2 pts) `&a` *Node ***
- d. (2 pts) `a->next->next` *Node **
- e. (2 pts) `&x` *double **
- f. (2 pts) `d` *char **
- g. (2 pts) `*d` *char*
- h. (2 pts) `argv[0]` *char **
- i. (2 pts) `argv[1][2]` *char*
- j. (2 pts) `a->next` *Node **
- k. (2 pts) `x` *double*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

- j. (2 pts) Convert 2137 from base 16 to base 2 *0010 0001 0011 0111*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    Node c;
    int d;
    double e;
    char f;
    Node *g;
    int *h;
    double *p;
    char *q;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `g->next` *Node **
- b. (2 pts) `argv[0]` *char **
- c. (2 pts) `&e` *double **
- d. (2 pts) `&g` *Node ***
- e. (2 pts) `g->next->next` *Node **
- f. (2 pts) `c` *Node*
- g. (2 pts) `g->data` *int*
- h. (2 pts) `argc` *int*
- i. (2 pts) `h` *int **
- j. (2 pts) `argv[1][2]` *char*
- k. (2 pts) `*g` *Node*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 10 from decimal to binary *1010*
- b. (2 pts) Convert 1000 0110 0000 from binary to hexadecimal *860*
- c. (2 pts) Convert 173 from decimal to binary *1010 1101*
- d. (2 pts) Convert 37 from decimal to base 2 *0010 0101*
- e. (2 pts) Convert 36 from base 8 to binary *011 110*
- f. (2 pts) Convert 106 from base 10 to base 2 *0110 1010*
- g. (2 pts) Convert 51ef from hexadecimal to binary *0101 0001 1110 1111*
- h. (2 pts) Convert 62 from base 8 to base 2 *110 010*
- i. (2 pts) Convert 110 111 111 from base 2 to octal *677*
- j. (2 pts) Convert bd21 from base 16 to base 2 *1011 1101 0010 0001*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    int z;
    Node a;
    double b;
    char c;
    int *d;
    Node *e;
    double *f;
    char *g;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `argc` *int*
- b. (2 pts) `e->data` *int*
- c. (2 pts) `argv[0]` *char **
- d. (2 pts) `&f` *double ***
- e. (2 pts) `*f` *double*
- f. (2 pts) `d` *int **
- g. (2 pts) `b` *double*
- h. (2 pts) `&b` *double **
- i. (2 pts) `e->next->next` *Node **
- j. (2 pts) `argv[1][2]` *char*
- k. (2 pts) `e->next` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt kiwi grape banana
```

- a. (2 pts) What is the value of `argc` in this case? 4
- b. (2 pts) What is the value of `argv[1][2]`? w
- c. (2 pts) What is the value of `argv[2][4]`? e
- d. (2 pts) What is the value of `argv[0][1]`? /

- i. (2 pts) Convert 47 from base 8 to binary *100 111*
- j. (2 pts) Convert 100 from decimal to binary *0110 0100*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    int g;  
    double h;  
    Node p;  
    char q;  
    int *r;  
    double *s;  
    Node *t;  
    char *w;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `*w` *char*
- b. (2 pts) `t->data` *int*
- c. (2 pts) `t->next` *Node **
- d. (2 pts) `s` *double **
- e. (2 pts) `&w` *char ***
- f. (2 pts) `t->next->next` *Node **
- g. (2 pts) `argv[1][2]` *char*
- h. (2 pts) `argv[0]` *char **
- i. (2 pts) `g` *int*
- j. (2 pts) `&g` *int **
- k. (2 pts) `argc` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt kiwi mango lime fig
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[2][1]`? *a*
- c. (2 pts) What is the value of `argv[0][3]`? *u*
- d. (2 pts) What is the value of `argv[1][1]`? *i*

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

a. (2 pts) Convert 1101 1001 0010 0001 from base 2 to base 16 *d921*

b. (2 pts) Convert 15 from octal to base 2 *001 101*

c. (2 pts) Convert 0111 0110 1110 1011 from binary to base 16 *76eb*

d. (2 pts) Convert 1100 1001 from binary to decimal *201*

e. (2 pts) Convert 001 001 010 from base 2 to octal *112*

f. (2 pts) Convert 0011 1000 from binary to base 10 *56*

g. (2 pts) Convert 010 011 111 from binary to base 8 *237*

h. (2 pts) Convert 30 from octal to binary *011 000*

i. (2 pts) Convert 17 from octal to base 2 *001 111*

j. (2 pts) Convert 144 from decimal to binary *1001 0000*

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    Node h;  
    int p;  
    double q;  
    char r;  
    Node *s;  
    int *t;  
    double *w;  
    char *x;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `&r` *char **
- b. (2 pts) `argc` *int*
- c. (2 pts) `s` *Node **
- d. (2 pts) `s->next->next` *Node **
- e. (2 pts) `argv[1][2]` *char*
- f. (2 pts) `&s` *Node ***
- g. (2 pts) `s->next` *Node **
- h. (2 pts) `p` *int*
- i. (2 pts) `*w` *double*
- j. (2 pts) `s->data` *int*
- k. (2 pts) `argv[0]` *char **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt cherry fig lemon
```

- a. (2 pts) What is the value of `argc` in this case? 4
- b. (2 pts) What is the value of `argv[0][3]`? *u*
- c. (2 pts) What is the value of `argv[2][2]`? *g*
- d. (2 pts) What is the value of `argv[1][2]`? *e*

End of Exam

total points=100

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

- a. (2 pts) Convert 111 100 from base 2 to octal 74
- b. (2 pts) Convert 111 100 010 from binary to octal 742
- c. (2 pts) Convert 31 from base 8 to base 2 011 001
- d. (2 pts) Convert 25 from base 8 to base 2 010 101
- e. (2 pts) Convert 8 from base 10 to binary 1000
- f. (2 pts) Convert 110 100 100 from base 2 to base 8 644
- g. (2 pts) Convert 111 110 011 from base 2 to base 8 763
- h. (2 pts) Convert 72 from octal to binary 111 010
- i. (2 pts) Convert 2 from base 8 to binary 010
- j. (2 pts) Convert 44 from decimal to binary 0010 1100

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    Node t;
    int w;
    double x;
    char y;
    Node *z;
    int *a;
    double *b;
    char *c;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `z->next` *Node **
- b. (2 pts) `argv[1][2]` *char*
- c. (2 pts) `argc` *int*
- d. (2 pts) `z->data` *int*
- e. (2 pts) `y` *char*
- f. (2 pts) `&c` *char ***
- g. (2 pts) `argv[0]` *char **
- h. (2 pts) `*z` *Node*
- i. (2 pts) `&x` *double **
- j. (2 pts) `c` *char **
- k. (2 pts) `z->next->next` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```

-

1. Please perform the following number conversions.

a. (2 pts) Convert bb3c from base 16 to binary *1011 1011 0011 1100*

b. (2 pts) Convert 0100 1101 from base 2 to base 10 *77*

c. (2 pts) Convert 1111 1000 0000 1101 from base 2 to hexadecimal *f80d*

d. (2 pts) Convert 9c86 from base 16 to binary *1001 1100 1000 0110*

e. (2 pts) Convert 010 111 000 from base 2 to octal *270*

f. (2 pts) Convert 0110 1101 from base 2 to decimal *109*

g. (2 pts) Convert f555 from base 16 to base 2 *1111 0101 0101 0101*

h. (2 pts) Convert 0001 1000 1101 0100 from binary to hexadecimal *18d4*

i. (2 pts) Convert 1100 0100 1011 0101 from base 2 to base 16 *c4b5*

j. (2 pts) Convert 1101 0100 from base 2 to base 10 *212*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double c;
    int d;
    Node e;
    char f;
    double *g;
    int *h;
    Node *p;
    char *q;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `&g` *double ***
- b. (2 pts) `p->next->next` *Node **
- c. (2 pts) `argv[0]` *char **
- d. (2 pts) `&d` *int **
- e. (2 pts) `*h` *int*
- f. (2 pts) `h` *int **
- g. (2 pts) `p->next` *Node **
- h. (2 pts) `d` *int*
- i. (2 pts) `argc` *int*
- j. (2 pts) `argv[1][2]` *char*
- k. (2 pts) `p->data` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt mango banana kiwi grape
```

- a. (2 pts) What is the value of `argc` in this case? 5
- b. (2 pts) What is the value of `argv[0][0]`? .
- c. (2 pts) What is the value of `argv[1][4]`? o
- d. (2 pts) What is the value of `argv[2][2]`? n

CS16—Final Exam
E03, F14, Phill Conrad, UC Santa Barbara
Wednesday, 12/15/2014

Name: _____

Umail Address: _____@ umail.ucsb.edu

- Please write your name **above AND AT THE TOP OF EVERY PAGE**
 - Be sure you turn in every page of this exam.
 - Each exam is numbered (e.g. Exam #137).
 - Each pages is numbered (e.g. Page 1, Page 2, etc.)
 - The last page clearly says "End of Exam".
 - This exam is **closed book, closed notes, closed mouth, cell phone off**
 - You are permitted **one sheet of paper** (max size 8.5x11") on which to write notes
 - These sheets will be collected with the exam, and might not be returned
 - Please write your name on your notes sheet
-

1. Please perform the following number conversions.

a. (2 pts) Convert 1110 1100 from binary to base 10 236

b. (2 pts) Convert 111 110 from binary to base 8 76

c. (2 pts) Convert 0010 1110 from base 2 to base 10 46

d. (2 pts) Convert 1111 1000 1100 1000 from base 2 to base 16 f8c8

e. (2 pts) Convert 1011 0010 from base 2 to decimal 178

f. (2 pts) Convert 1001 1111 1100 0001 from binary to hexadecimal 9fc1

g. (2 pts) Convert 111 101 111 from binary to octal 757

h. (2 pts) Convert 40 from base 8 to binary 100 000

i. (2 pts) Convert 011 001 100 from binary to base 8 314

j. (2 pts) Convert 0 from base 10 to binary 0000

2. Given the following declarations:

```
struct Node {  
    int data;  
    Node *next;  
};  
  
int main(int argc, char *argv[]) {  
    int d;  
    Node e;  
    double f;  
    char g;  
    int *h;  
    Node *p;  
    double *q;  
    char *r;  
  
    return 0;  
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `p->next->next` *Node **
- b. (2 pts) `f` *double*
- c. (2 pts) `p->data` *int*
- d. (2 pts) `h` *int **
- e. (2 pts) `argv[0]` *char **
- f. (2 pts) `argc` *int*
- g. (2 pts) `&p` *Node ***
- h. (2 pts) `&g` *char **
- i. (2 pts) `argv[1][2]` *char*
- j. (2 pts) `*h` *int*
- k. (2 pts) `p->next` *Node **

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {

- j. (2 pts) Convert 2555 from hexadecimal to binary *0010 0101 0101 0101*

2. Given the following declarations:

```
struct Node {
    int data;
    Node *next;
};

int main(int argc, char *argv[]) {
    double f;
    Node g;
    int h;
    char p;
    double *q;
    Node *r;
    int *s;
    char *t;

    return 0;
}
```

Specify the type of each of these expressions (e.g. `int`, `int *`, etc.

- a. (2 pts) `r->next` *Node **
- b. (2 pts) `&q` *double ***
- c. (2 pts) `argv[0]` *char **
- d. (2 pts) `g` *Node*
- e. (2 pts) `r->next->next` *Node **
- f. (2 pts) `*q` *double*
- g. (2 pts) `t` *char **
- h. (2 pts) `&h` *int **
- i. (2 pts) `argv[1][2]` *char*
- j. (2 pts) `r->data` *int*
- k. (2 pts) `argc` *int*

3. (10 pts) In 24 hour time:

- midnight is represented by the hour 0
- 1am through 11am are represented at hour=1 through hour=11
- noon is represented by hour=12
- 1pm through 11pm are represented by hour=13 through hour=23
- minute is a value between 0 and 59.

Assume the following struct:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

Write the full function definition for a function that would have the following prototype:

```
bool isValidTime(Time t);
```

Comply with these instructions for full credit:

- The function should return true if both of the members of the struct t are valid values for a struct Time. Otherwise the function should return false.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

4. (10 pts) Given the same struct definition as in the previous problem, with the same understanding of how are the fields for hour and minutes are to be treated in 24 hour time:

```
// Time of day in 24 hour time
struct Time {
    int h; // hour
    int m; // minute
};
```

And given the same function prototype for `isValidTime`, which you can assume is ALREADY DEFINED and available for you to use (do not redefine it in this problem)

```
bool isValidTime(Time t);
```

Write the full function definition for a function that would have the following prototype:

```
bool setTime(Time *t, int hour, int min);
```

Comply with these instructions for full credit:

- If the pointer `t` is `NULL`, return `false`, and do nothing.
- If the pointer `t` is not `NULL`, copy the values from `hour` and `min` into the corresponding fields in the struct pointed to by `t`.
- Then, USING A FUNCTION CALL TO `isValidTime`, NOT BY REPEATED THE CODE YOU WROTE FOR THAT FUNCTION, check whether the struct you just initialized is valid. If so, return `true`, otherwise return `false`. Hint: be careful about matching the types of formal and actual parameters.

5. (10 pts) Given the struct definitions shown below (which are exactly as in lab09 and lab09), write the full function definition for a function that would have the following prototype:

```
int countOccurrences(LinkedList * list, int k);
```

Comply with these instructions for full credit:

- The function should return 0 if `list` is NULL, or the linked list that is pointed to is an empty list.
- Otherwise, the function should go through the linked list and count the number of nodes in the list that have the value `k` in the data member.
- Assume that any `#include` directives you need are ALREADY DONE. I ONLY want the function definition. I want the full function definition, and NOTHING ELSE. PERIOD.

```
struct Node {  
    int data;  
    Node *next;  
};  
  
struct LinkedList {  
    Node *head;  
    Node *tail;  
};
```

6. (10 pts) Again, given the following struct definitions, exactly as in lab09 and lab09

Here is a partial implementation of `addIntToEndOfList`. It has one extra line of code added that will result in a memory leak, and it has one crucial line of code missing.

You have two jobs, and you must do this precisely as stated to get full credit:

- (5 pts) Add EXACTLY ONE LINE OF CODE, the missing line that will cause the function to work properly.
- (5 pts) Cross out EXACTLY ONE LINE OF CODE, the one that causes a memory leak.

```
struct Node {
    int data;
    Node *next;
};

struct LinkedList {
    Node *head;
    Node *tail;
};
```

HINT: Trace through the code with a picture, both starting from an empty list, and one that already has at least one node in it. Think about what you WANT the "after" picture to look like, vs. what the code you see here actually does. Then you'll see both things you need to fix.

NOTE: there may be 'other' ways to fix the code. I DON'T WANT THOSE. Fix it according to the instructions. Also, note that I've put exactly the same amount of space between each line, so that where the white space is is NOT a clue as to where the missing line of code should go.

```
void addIntToEndOfList(LinkedList *list, int value) {
    assert(list!=NULL); // if list is NULL, we can do nothing.

    Node *p;

    p = new Node;
    p->data = value;
    p->next = NULL;

    if (list->head == NULL) {
        list->head = new Node;
        list->head = p;
    } else {
        list->tail->next = p;
        list -> tail = p;
    }
}
```

7. Assume the main function in the program `runIt.cpp` starts with:

```
int main(int argc, char *argv[]) {  
...
```

Further, suppose this program is invoked with the following command line:

```
./runIt lemon apple
```

- a. (2 pts) What is the value of `argc` in this case? 3
- b. (2 pts) What is the value of `argv[0][6]`? *t*
- c. (2 pts) What is the value of `argv[1][4]`? *n*
- d. (2 pts) What is the value of `argv[2][2]`? *p*
